Task Boards

Task boards are the core organizational unit in Pathwise. Each board contains columns (e.g., To Do, In Progress, Done) and cards representing individual tasks. Cards can be assigned to team members, given due dates, and tagged with labels for filtering.

Boards can be duplicated as templates for recurring projects, which is commonly used by teams running the same type of project on a repeating schedule, such as a monthly content calendar or a recurring client onboarding checklist. When a board is duplicated, all cards, columns, and labels are copied exactly as they appear in the source board, but assignees and due dates are cleared by default. This default behavior exists because most recurring templates are reused by different team members each cycle, so retaining the previous cycle's assignments would usually create confusion rather than save time. If a team wants to preserve assignments during duplication, for example when duplicating a board to create a near-identical parallel project with the same owners, the “preserve assignments” option can be selected during the duplication step. This option does not preserve due dates even when assignments are preserved; due dates must always be re-entered manually after duplication, since Pathwise assumes a duplicated board represents a new timeline even when the people involved remain the same. Comments and file attachments on cards are never carried over during duplication, regardless of which options are selected, since these are considered historical records of the original board rather than reusable template content.

Custom Workflows (Growth and Enterprise only)

Custom workflows allow teams to define automated rules, such as “when a card moves to Done, notify the project owner” or “when a due date passes without the card moving, flag it as overdue and alert the assignee.” Workflows are configured per-board and do not apply retroactively to cards created before the workflow was set up.

Reporting

Basic reporting (all plans) shows task completion rates and overdue task counts per board. Advanced reporting (Growth and Enterprise) adds team velocity tracking, burndown charts, and exportable CSV reports covering up to 12 months of historical data. Reports refresh once every 24 hours; there is currently no real-time reporting option.

Single Sign-On (SSO)

SSO is available on Growth and Enterprise plans via SAML 2.0. Setup requires an admin to configure the identity provider connection in Account Settings > Security. Once SSO is enabled, password-based login can optionally be disabled for all users except the account owner, who always retains password login as a fallback.
