

Troubleshooting & Known Issues

doc_troubleshooting | Pathwise Help Center

Notifications Not Arriving

If email notifications aren't arriving, first check Account Settings > Notifications to confirm they're enabled for the relevant event types. If enabled and still not arriving, check spam/junk folders — Pathwise notification emails come from notifications@pathwise example. If the issue persists beyond 24 hours, contact support with your account email for investigation.

SSO Login Loop

Some SAML identity providers can cause a redirect loop if the Assertion Consumer Service (ACS) URL is misconfigured. Double-check the ACS URL matches exactly what's shown in Account Settings > Security > SSO Configuration. This is the most common cause of SSO login failures reported to support.

Slow Board Loading with Large Task Counts

Boards with more than 500 active cards may experience slower load times. This is a known limitation of the current board rendering approach. As a workaround, archiving completed cards regularly improves performance. A performance improvement for large boards is on the product roadmap but not yet scheduled.

CSV Export Missing Custom Fields

Advanced reporting CSV exports currently include standard fields (task name, status, assignee, due date) but do not yet include custom fields added via Custom Workflows. This is a known gap; there is no workaround at this time other than manually cross-referencing custom field data from the board view.

Offline Mobile Sync Conflicts (Unresolved)

Pathwise does not currently have a documented resolution for syncing conflicts when the same task card is edited offline on mobile by two different users simultaneously — this scenario is rare but unresolved, and support currently advises manually reconciling changes if it occurs.
